

SAMPLE — FOR DEMONSTRATION ONLY, NOT A PUBLISHED MISMO ESTIMATE

Common Confidence Score (CCS)

Illustrative per-loan ROI model

Estimated savings

\$22 per loan (illustrative)

Where the estimate comes from

This sample breakdown models three areas where a standardized AVM confidence scale could reduce cost per loan compared to today's incompatible, provider-specific scoring scales. These figures are placeholders for demonstration purposes and do not represent a real, published MISMO ROI model.

Cost driver	Illustrative savings	Basis (sample)
Fewer manual AVM re-reviews	\$9	Less time spent manually cross-checking or overriding scores across incompatible vendor scales
Faster QC documentation	\$7	A shared scale makes it easier to demonstrate consistent confidence levels for the federal AVM rule
Fewer vendor-switch re-runs	\$6	Fewer cases requiring a second AVM when the first score isn't clearly interpretable or comparable
Estimated total per loan	\$22	

Sample document generated to demonstrate the "View ROI breakdown" link pattern on the Work Product Overview redesign. Once a real CCS ROI model is published, this document would be replaced by the actual analysis.
